The quality of the leather comes from a careful selection of raw hides from Europe or outside Europe, thickness 0,9-1,0 mm, obtained with chrome tanning and dyed in the tub with aniline. The hides are worked and treated with respect for the environment using non-toxic products in order to maintain their natural characteristics and therefore the distinctive signs of the life of the animal appear with greater frequency than in corrected hides. This guarantees and enhances their natural beauty.

The leather produced is water-repellent to the right degree while bearing in mind the needs for permeability and breathability that only genuine leather provides. Irregularities in the surface such as wrinkles, stretch marks, veining, and differences in grain or shades of colour are not defects but testify to the natural life of the animal and render each piece unique and unlike any other. For these reasons, we cannot guarantee the same shades of colour in one batch and another.
